LAYOUT EXAMPLE

Our **purpose** is to create value by collaboratively crafting elegant, data-driven solutions for significant problems.

To achieve this, we subscribe to the **values** of *Trustworthy Leadership*, *Collaborative Learning* and *Creative Craftsmanship*.

To our clients, Praelexis **promises** to be *Trendsetters*, *Academically Excellent*, *Agile and Adaptable* and *Deeply Immersed*.

Features of the Praelexis Credit Toolkit

Internationally, banks are regulated by the three BASEL accords, with the latest, BASEL III, dating from November 2010. The main take-away for our purposes is that it requires banks to have a minimum amount of common equity and minimum liquidity ratio based on the risk exposure of the bank. In practice this means, among other things, that the requirements can be relaxed if a bank can more accurately estimate its risk exposure. This encourages the development of more accurate credit granting and/or risk assessment models.

During the typical credit modelling process a number of disparate systems and tools are used by members of the technical team, as well as by the management and business teams. In order to navigate these tools, a substantial amount of specialised knowledge is expected from the user. Disjoint tools, each performing a very specific aspect of the credit modelling process, adds to the complexity of the process. If the integration of the different steps is not seamless, the modelling process becomes tedious, time-consuming and error-prone.

The flexibility of Praelexis Credit allows state-of-the-art machine learning techniques to be combined with the tried and tested credit modelling procedures. Superior credit models are created seamlessly and reliably by following best-practice, model life-cycle management. Reliable software development and credit modelling practices are incorporated into the platform which allows, for example, the effortless generation of auditing documentation.

The Praelexis Credit Toolkit allows you to:

- Enhance bureau scores by quickly and cost-effectively incorporating your own data.
- Build custom credit scorecards interactively using open-source tools.
- Incorporate non-standard data such as transactions, text, or data that only your organisation has access to.
- Put your credit model into production

Integrated, Flexible, Powerful

The credit modelling solution offered by Praelexis Credit includes a Jupyter Lab notebook utilising an underlying core credit library. The notebook is developed with the following main design principle in mind:

An integrated environment providing maximum flexibility as well as ease-of-use for the credit modeller and manager.

This is achieved by utilising the power of the Python ecosystem exposed through a Jupyter Lab notebook. Since development takes place in the Python environment, the modeller is not restricted to any prescribed modelling solution. For example, should the modeller want to develop a model based on a deep neural network, he/she can build it on top of TensorFlow, Keras, PyTorch, or any other framework by simply installing and importing it into the notebook.

At the same time, the Praelexis Credit solution offers a complete toolset for developing a credit model, based on Weight-Of-Evidence (WOE) and logistic regression. This approach should be familiar to most, if not all, credit modellers.

The notebook consists of the following sections:

- Data Loading and Preprocessing
- Target Definition and Roll Rates
- Initial Variable Selection
- Manual Binning
- Variable Reduction
- Scorecard Development
- Model Performance and Stability Checks
- Model and Client Summaries
- Deployment on a Kubernetes cluster (this requires setting up the necessary environment in the user's organisation)

In the rest of this Whitepaper we will be discussing the functionality of the Praelexis Credit Toolkit according to these modules.
